

(a) Antipattern

```
# Antipattern: stream-and-write
writer = EdfWriter(path, ...)

while acquiring:
    block = device.read(100)
    writer.writeSamples([block])

writer.close()
```

(b) Recommended pattern

```
# Recommended: buffer-then-flush
writer = EdfWriter(path, ...)
buf = np.array([])

while acquiring:
    block = device.read(100)
    buf = np.concatenate([buf, block])
    while len(buf) >= fs:
        writer.writeSamples([buf[:fs]])
        buf = buf[fs:]

# flush remainder with last-value padding
if len(buf) > 0:
    pad = np.full(fs - len(buf), buf[-1])
    tail = np.concatenate([buf, pad])
    writer.writeSamples([tail])
writer.close()
```
